TITLE

COMPOSITIONS OF A FLUOROETHER AND A HYDROFLUOROCARBON

FIELD OF THE INVENTION

10

This invention relates to compositions that include at least one fluoroether and at least one hydrofluorocarbon. Such compositions may be used as refrigerants, cleaning agents, expansion agents for polyolefins and polyurethanes, aerosol propellants, heat transfer media, gaseous dielectrics, fire extinguishing agents, power cycle working fluids, polymerization media, particulate removal fluids, carrier fluids, buffing abrasive agents, displacement drying agents and as carriers for sterilant gases.

15

Included in this invention are compositions which include a fluoroether and a hydrofluorocarbon in which the halocarbon global warming potential (HGWP) of the hydrofluorocarbon is lowered by adding the fluoroether to the hydrofluorocarbon. Also included in this invention are compositions a fluoroether and a hydrofluorocarbon that are azeotropic or azeotrope-like.

20

BACKGROUND OF THE INVENTION

Fluorinated hydrocarbons have many uses, one of which is as a refrigerant. Such refrigerants include dichlorodifluoromethane (CFC-12) and chlorodifluoromethane (HCFC-22).

25

In recent years it has been suggested that certain chlorofluorocarbon (CFC) and hydrochlorofluorocarbon (HCFC) refrigerants released into the atmosphere may adversely affect the ozone layer. Although this proposition has not yet been completely established, there is a movement toward the control of the use and the production of certain CFCs and HCFCs under an international agreement.

30

In order to address the potential problem of ozone depletion, it has been suggested that chlorofluorocarbon refrigerants and hydrochlorofluorocarbon refrigerants be replaced with hydrofluorocarbon refrigerants. Since the hydrofluorocarbon (HFC) refrigerants contain no chlorine, they have zero ozone depletion potential.

35

Another environmental concern is the role of CFCs in the "greenhouse effect". The greenhouse effect refers to the warming of the Earth's climate that takes place when atmospheric gases, which are relatively transparent to visible light and allow sunshine to reach the Earth, trap heat by absorbing infrared radiation released by the Earth.

40

5 There is presently no universally accepted methodology for combining all relevant factors into a single global warming potential for emissions of gases such as CFCs. One approach is to define the greenhouse effect of a compound in terms of a potential to enhance global warming relative to a known standard. One such definition is known as a halocarbon global warming potential (HGWP), which is the
10 ratio of incremental radiative warming resulting from an emission of a gas, over the lifetime of the gas in the atmosphere, to the calculated warming that would result from a release of the same mass of reference gas CFC-11.

 While HFCs may have a zero ozone depletion potential, some HFCs may have an HGWP that may be undesirable and subject to governmental
15 regulation. Accordingly, there is also a demand for the development of refrigerants that have a low ozone depletion potential while at the same time having a low HGWP.

 It is preferred that refrigerants that include more than one component be azeotropic or azeotrope-like so that the composition of the refrigerant does not
20 change when leaked or discharged to the atmosphere from refrigeration equipment. A change in composition of a refrigerant may affect its properties, such as performance or flammability.

 It is also desirable to use compositions that have a low ozone depletion potential and/or a low HGWP and/or that are azeotropic or azeotrope-like as cleaning agents, blowing agents in the manufacture of closed-cell
25 polyurethane, phenolic and thermoplastic foams, as propellants in aerosols, as heat transfer media, gaseous dielectrics, fire extinguishing agents, power cycle working fluids, such as for heat pumps, inert media for polymerization reactions, fluids for removing particulates from metal surfaces, as carrier fluids that may be used, for
30 example, to place a fine film of lubricant on metal parts, or as buffing abrasive agents to remove buffing abrasive compounds from surfaces such as metal, as displacement drying agents for removing water, such as from jewelry or metal parts, as resist developers in conventional circuit manufacturing techniques including chlorine-type developing agents, and as strippers for photoresists when used with,
35 for example, a chlorohydrocarbon, such as 1,1,1-trichloroethane or trichloroethylene.

5

SUMMARY OF THE INVENTION

This invention relates to compositions that include a fluoroether and a hydrofluorocarbon. Included in this invention are compositions of a cyclic or acyclic hydrofluoroether of the formula $C_aF_bH_{2a+2-b}O_c$ wherein $a=2$ or 3 and $3 \leq b \leq 8$ and $c=1$ or 2 and a hydrofluorocarbon of the formula $C_nF_mH_{2n+2-m}$ wherein
10 $1 \leq n \leq 4$ and $1 \leq m \leq 8$. Such compositions may be used as refrigerants, cleaning agents, expansion agents for polyolefins and polyurethanes, aerosol propellants, heat transfer media, gaseous dielectrics, fire extinguishing agents, power cycle working fluids, polymerization media, particulate removal fluids, carrier fluids, buffing abrasive agents, and displacement drying agents.

15

Another aspect of this invention relates to the discovery that the HGWP of a hydrofluorocarbon can be lowered by adding to the hydrofluorocarbon a fluoroether having a lower HGWP than the HGWP of the hydrofluorocarbon. Accordingly, the present invention relates to a composition of a first component that includes a hydrofluorocarbon and a second component that includes a fluoroether
20 that has an HGWP less than the HGWP of the first component, such that the HGWP of the composition is less than the HGWP of the first component.

Also included in this invention are compositions which include a fluoroether and a hydrofluorocarbon that are azeotropic or azeotrope-like.

25

30 formula $C_nF_mH_{2n+2-m}$ wherein $1 \leq n \leq 4$ and $1 \leq m \leq 8$. 5 By "azeotropic" composition is meant a constant boiling liquid
admixture of two or more substances that behaves as a single substance. One way to
characterize an azeotropic composition is that the vapor produced by partial
evaporation or distillation of the liquid has the same composition as the liquid from
which it was evaporated or distilled, that is, the admixture distills/refluxes without
10 compositional change. Constant boiling compositions are characterized as
azeotropic because they exhibit either a maximum or minimum boiling point, as
compared with that of the non-azeotropic mixtures of the same components.

By "azeotrope-like" composition is meant a constant boiling, or
substantially constant boiling, liquid admixture of two or more substances that
15 behaves as a single substance. One way to characterize an azeotrope-like
composition is that the vapor produced by partial evaporation or distillation of the
liquid has substantially the same composition as the liquid from which it was
evaporated or distilled, that is, the admixture distills/refluxes without substantial
compositional change.

20 It is recognized in the art that a composition is azeotrope-like if, after
50 weight percent of the composition is removed such as by evaporation or boiling
off, the difference in vapor pressure between the original composition and the
composition remaining after 50 weight percent of the original composition has been
removed is less than 10 percent, when measured in absolute units. By absolute
25 units, it is meant measurements of pressure and, for example, psia, atmospheres,
bars, torr, dynes per square centimeter, millimeters of mercury, inches of water and
other equivalent terms well known in the art. If an azeotrope is present, there is no
difference in vapor pressure between the original composition and composition
remaining after 50 weight percent of the original composition has been removed.

30 Therefore, included in this invention are compositions of effective
amounts of a fluoroether and an HFC such that after 50 weight percent of an
original composition is evaporated or boiled off to produce a remaining
composition, the difference in the vapor pressure between the original composition
and the remaining composition is about 10 percent or less. Examples of such
35 compositions include the following:

For purposes of this invention, "effective amount" is defined as the amount of each component of the inventive compositions which, when combined, results in the formation of an azeotropic or azeotrope-like composition. This definition includes the amounts of each component, which amounts may vary
10 depending on the pressure applied to the composition so long as the azeotropic or azeotrope-like compositions continue to exist at the different pressures, but with possible different boiling points.

Therefore, effective amount includes the amounts, such as may be expressed in weight percentages, of each component of the compositions of the
15 instant invention which form azeotropic or azeotrope-like compositions at temperatures or pressures other than as described herein.

For the purposes of this discussion, azeotropic or constant-boiling is intended to mean also essentially azeotropic or essentially-constant boiling. In other words, included within the meaning of these terms are not only the true azeotropes
20 described above, but also other compositions containing the same components in different proportions, which are true azeotropes at other temperatures and pressures, as well as those equivalent compositions which are part of the same azeotropic system and are azeotrope-like in their properties. As is well recognized in this art, there is a range of compositions which contain the same components as
25 the azeotrope, which will not only exhibit essentially equivalent properties for refrigeration and other applications, but which will also exhibit essentially equivalent properties to the true azeotropic composition in terms of constant boiling characteristics or tendency not to segregate or fractionate on boiling.

It is possible to characterize, in effect, a constant boiling admixture
30 which may appear under many guises, depending upon the conditions chosen, by any of several criteria:

* The composition can be defined as an azeotrope of A, B, C (and D...) since the very term "azeotrope" is at once both definitive and limitative, and requires that effective amounts of A, B, C (and D...)
35 for this unique composition of matter which is a constant boiling composition.

* It is well known by those skilled in the art, that, at different pressures, the composition of a given azeotrope will vary at least to some degree, and changes in pressure will also change, at least to
40 some degree, the boiling point temperature. Thus, an azeotrope of A, B, C (and D...) represents a unique type of relationship but with a

5 variable composition which depends on temperature and/or pressure. Therefore, compositional ranges, rather than fixed compositions, are often used to define azeotropes.

* The composition can be defined as a particular weight percent relationship or mole percent relationship of A, B, C (and D...), while
10 recognizing that such specific values point out only one particular relationship and that in actuality, a series of such relationships, represented by A, B, C (and D...) actually exist for a given azeotrope, varied by the influence of pressure.

* An azeotrope of A, B, C (and D...) can be characterized by defining
15 the compositions as an azeotrope characterized by a boiling point at a given pressure, thus giving identifying characteristics without unduly limiting the scope of the invention by a specific numerical composition, which is limited by and is only as accurate as the analytical equipment available.

20 The azeotrope or azeotrope-like compositions of the present invention can be prepared by any convenient method including mixing or combining the desired amounts. A preferred method is to weigh the desired component amounts and thereafter combine them in an appropriate container.

There is no universally accepted methodology for combining all
25 relevant factors into a single global warming potential for greenhouse gas emissions. One way to define the greenhouse effect of a compound is to determine its potential to enhance global warming relative to a known standard. In the present invention, the halocarbon global warming potential (HGWP) of several fluoroethers and HFCs were determined using known estimating techniques.

30 HGWP is defined as the ratio of incremental radiative warming resulting from an emission of a gas, over the lifetime of the gas in the atmosphere, to the calculated warming that would result from a release of the same mass of reference gas CFC-11, which has an HGWP of 1.0. The calculation of HGWP is discussed in Fisher et. al., Model Calculations on the Relative Effects of CFCs and their Replacements on Global Warming, Nature, Volume 344, pp. 513-516 (1990),
35 the text of which is incorporated herein by reference.

It has been discovered that the HGWP of an HFC can be lowered by adding to the HFC a fluoroether having a lower HGWP than the HGWP of the HFC such that the combination of the HFC and the fluoroether has an HGWP
40 lower than the HGWP of the HFC. Therefore, the present invention relates to a composition of a first component that includes a hydrofluorocarbon and a second

- 5 component that includes a fluoroether that has an HGWP less than the HGWP of the first component, such that the HGWP of the composition is less than the HGWP of the first component.

The scope of this invention includes a single fluoroether compound added to a single HFC, as well as a single fluoroether added to mixtures of two or
10 more HFCs. Further, the invention includes mixtures of one or more fluoroethers added to a single HFC, as well as mixtures of one or more fluoroethers added to mixtures of two or more HFCs.

The HGWP of a composition of components A and B is equal to [fractional composition of A] x [HGWP of A] + [fractional composition of B] x
15 [HGWP of B]. The HGWP of a composition of more than two components is determined in the same way, that is, by multiplying the fractional composition of a component by its HGWP, and then adding together the fractional HGWPs of all the components.

Specific examples illustrating the invention are given below. Unless
20 otherwise stated therein, all percentages are by weight. It is to be understood that these examples are merely illustrative and in no way are to be interpreted as limiting the scope of the invention. All values given in the Examples are +/- 5 percent.

EXAMPLE 2

Impact of Vapor Leakage on Vapor Pressure at 25°C

10 A vessel is charged with an initial composition at 25°C, and the vapor pressure of the composition is measured. The composition is allowed to leak from the vessel, while the temperature is held constant at 25°C, until 50 weight percent of the initial composition is removed, at which time the vapor pressure of the composition remaining in the vessel is measured. The results are summarized below.

The following compounds have the indicated HGWPs (all
45 HGWP values are relative to CFC-11 = 1.0). The HGWPs were estimated relative

5 to the HGWP of CFC-11 as follows:

$$\text{HGWP} = (\text{IR abs (A)} / \text{IR abs. (CFC-11)}) \times \\ (\text{t (A)} / \text{t (CFC-11)}) \times \\ (\text{mass (CFC-11)} / \text{mass (A)})$$

where A is the gas being analyzed;

10 IR abs. is the total infrared absorption cross section in the
region of interest, that is, where H₂O and CO₂
do not absorb;

t = atmospheric lifetime; and

mass = atomic mass.

15 The novel compositions of this invention, including the azeotropic or azeotrope-like compositions, may be used to produce refrigeration by condensing the compositions and thereafter evaporating the condensate in the vicinity of a body to be cooled. The novel compositions may also be used to produce heat by condensing the refrigerant in the vicinity of the body to be heated and thereafter evaporating the refrigerant.

20 In addition to refrigeration applications, the novel constant boiling or substantially constant boiling compositions of the invention are also useful as aerosol propellants, heat transfer media, gaseous dielectrics, fire extinguishing agents, expansion agents for polyolefins and polyurethanes and power cycle working fluids.

25 Additives such as lubricants, corrosion inhibitors, stabilizers, dyes and other appropriate materials may be added to the novel compositions of the invention for a variety of purposes provided they do not have an adverse influence on the composition for its intended application. Preferred lubricants include esters having a molecular weight of greater than 250.
